

Ans-(1)

This week, I analyzed the business problem related to inventory waste caused by raw material expiry and identified the key data points required for tracking inventory. I designed the structure of the inventory management dashboard, including raw material logs, finished goods logs, and a waste alert mechanism. I also studied how batch-wise inventory tracking can improve production planning and reduce wastage.

Ans-(2)

One challenge was understanding how raw material expiry dates affect production schedules and finished goods inventory. To overcome this, I researched inventory management practices and mapped the flow of materials from procurement to production. This helped me define the dashboard requirements more clearly and design a practical tracking system.

Ans-(3)

Beyond the basic requirements, I explored implementing color-coded expiry alerts using conditional formatting to make critical inventory issues visible at a glance. I also considered adding summary metrics such as upcoming expiries, total available stock, and estimated wastage risk to improve decision-making for business users.

Ans-(4)

I would appreciate guidance on industry-standard inventory tracking practices used in food processing businesses. Additionally, examples of real inventory logs or best practices for managing batch-wise expiry tracking would help me further improve the dashboard design and make it more practical for business use.
