

Dashboard Narrative

Dashboard Overview

This dashboard provides a visual overview of raw material inventory in a food processing unit. It helps monitor total quantity, remaining stock, raw material distribution, and expiry status through interactive charts and filters, enabling users to analyze inventory efficiently and support better operational decision-making.

Key Insights

The dashboard shows that different raw materials contribute almost equally to the inventory, indicating balanced stock distribution. Potato and Spinach have the highest inventory quantity, while Tomato has the lowest. The remaining stock analysis helps identify materials that require replenishment sooner than others. The Expiry Status chart indicates that all inventory items are currently classified as **Fresh**, as the dataset contains only future expiry dates. This suggests that no immediate risk of product expiry exists during the selected period.

Business Recommendation

The organization should continue monitoring inventory levels regularly and update expiry records on time to prevent future wastage. Maintaining an optimal balance between available quantity and remaining stock will improve inventory planning, reduce unnecessary purchases, and support efficient production scheduling in the food processing unit.

Data Limitations

This dashboard is based on a sample dataset containing future expiry dates only. Therefore, no Expired or Near Expiry categories are visible. The dashboard does not include real-time inventory updates, supplier information, or demand forecasting.
