

Weekly Progress Report – Week 5

Intern Name: Abhay Tayal **Intern ID:** 26100250 **Week:** 5

Month-1 Reflection Report

During the first month of the Business Intelligence internship, I experienced significant growth in both my technical knowledge and analytical thinking. At the beginning of the program, I had only a basic understanding of Python and Power BI, with very limited exposure to SQL, Business Intelligence concepts, and real-world data analysis. I was not confident in selecting business problems, working with datasets, or presenting business insights through dashboards. Over the past five weeks, I have learned how to write SQL queries, clean and prepare datasets using Python, perform Exploratory Data Analysis (EDA), create different types of business visualizations, and develop interactive dashboards using Google Looker Studio. I also gained a better understanding of Business Intelligence workflows, KPI selection, and data-driven decision-making, which has greatly improved my confidence in handling real business scenarios.

Throughout the learning journey, I faced several challenges that helped me improve my problem-solving abilities. Initially, I found it difficult to understand SQL joins, data cleaning techniques, selecting appropriate chart types for different business questions, and identifying meaningful KPIs for business analysis. Building dashboards that effectively communicated business insights was also challenging. I overcame these difficulties through regular practice, careful study of documentation, experimenting with different approaches, and learning from real-world Business Intelligence case studies. Breaking complex tasks into smaller steps made the overall learning process much easier and strengthened my understanding of the complete BI workflow.

The internship has helped me develop practical skills that are directly applicable in the Business Intelligence domain. I have learned SQL for querying relational databases, Python and Pandas for data preparation, Exploratory Data Analysis techniques, professional data visualization using Matplotlib and Seaborn, dashboard development using Google Looker Studio, KPI design, Business Intelligence strategy planning, and BI maturity assessment. These experiences have improved not only my technical capabilities but also my ability to think from a business perspective and communicate insights effectively.

Moving forward, my goal is to continue improving my Business Intelligence skills by learning advanced dashboard design, data storytelling, predictive analytics, and more sophisticated analytical techniques. I also aim to successfully complete my capstone project, build an industry-ready BI portfolio, and strengthen my ability to solve real business problems using data-driven decision-making. I believe the remaining weeks of the internship will provide valuable opportunities to further enhance my technical expertise and prepare me for a professional career in the field of Business Intelligence.
