

Week 6 – Weekly Progress Report

During Week 6, I learned how Artificial Intelligence can assist Business Intelligence by generating analytical questions and business insights from a dataset. I created an AI Validation Log using my HimShakti Food Processing Raw Material Expiry & Inventory Waste Dashboard dataset, where I generated five AI-assisted business questions and evaluated each one against the actual data. This activity helped me understand that AI can speed up the analytical process, but every insight must be validated before being used for business decisions. I also developed a five-slide Insight Deck that presented the business problem, dataset overview, key findings, business impact, and actionable recommendations in a structured and professional format.

One of the biggest challenges I faced this week was differentiating between AI-generated assumptions and insights that were actually supported by the dataset. Initially, some AI suggestions appeared reasonable, but after validating them with the available inventory data, I realized that additional business information would be required before making certain conclusions. This experience improved my critical thinking skills and taught me the importance of fact-checking AI-generated outputs before using them in any Business Intelligence report or presentation.

Beyond the module requirements, I focused on presenting my analysis in a professional business format rather than simply completing the technical tasks. I organized the AI Validation Log, prepared a structured Insight Deck, and practiced explaining the findings in simple, non-technical language suitable for business stakeholders. This helped me improve both my analytical and presentation skills while gaining a better understanding of how AI and Business Intelligence can work together to support real-world decision-making.

For the upcoming week, I look forward to exploring more advanced Business Intelligence concepts, improving dashboard storytelling techniques, and learning how AI can further enhance data analysis while ensuring that every recommendation remains accurate, reliable, and supported by real business data.
