

Week 7 (PROGRESS REPORT)

During Week 7 of the AI-Enabled Business Intelligence Internship, I strengthened my understanding of prompt engineering and its role in improving AI-assisted Business Intelligence workflows. At the beginning of the internship, I could use AI tools only for simple queries, but through the activities completed over the past weeks, I have learned how to design structured prompts that generate more relevant, accurate, and business-focused outputs. This week, I created ten different prompts for various BI tasks, compared three prompt variations for the same task, and observed how adding context, defining an AI role, and specifying the required output format significantly improved the quality of responses. I also prepared a Board-Level KPI Summary for the HimShakti Food Processing Raw Material Expiry & Inventory Waste Dashboard and carefully validated every AI-generated statement against the actual project context before making necessary corrections. One of the key challenges I faced was distinguishing between AI-generated assumptions and insights that were actually supported by the available data. I addressed this by reviewing every statement critically and ensuring that only fact-based information was included in the final report. This experience improved my analytical thinking, prompt-writing skills, and ability to use AI responsibly in Business Intelligence projects. Going forward, I aim to continue applying these prompt engineering techniques while developing more advanced dashboards, generating reliable business insights, and supporting better data-driven decision-making.
